In terms of the power output in megawatts, the average project in 2015 was about 2.9MW, "relatively small utility-scale batteries," whereas in 2020, the average is more like 21MW. "That's really significant because you can play on both power outputs and storage duration to reduce the cost per MWh of storage," Tiffen Brandily said.

o There exist a number of cost comparison sources for energy storage technologies For example, work performed for Pacific Northwest National Laboratory provides cost and performance characteristics for several different battery energy storage (BES) technologies (Mongird et al. 2019). o Recommendations:

That's according to BloombergNEF (BNEF), which released its first-ever survey of long-duration energy storage costs last week. Based on 278 cost data points, the survey examined seven different LDES technology groups and 20 technology types. ... required for a 4-hour duration Li-ion battery energy storage system (BESS) was higher at US\$304 ...

Incentives and subsidies: Government incentives and subsidies can help offset the costs of battery storage systems, making them more affordable for consumers. Estimating the Cost of a 1 MW Battery Storage System. Given the range of factors that influence the cost of a 1 MW battery storage system, it's difficult to provide a specific price.

It depends on your energy consumption, solar panel output, the battery's storage capacity and how many days you'd like your batteries to provide power (called autonomy of power). But for the average household - consuming 4,200kWh per year with a standard, 13.5kWh battery and allowing for 2-3 days of battery power - two batteries should suffice.
