

Energy storage box loading and unloading

What if a container is unloaded on the unloading platform?

If the container is unloaded on the unloading platform, it is required to be used with the unloading platform or tooling. The height of the unloading platform and the height of the unloading tooling should be kept at the basic level with the bottom of the container (loading bottom plate), and the height tolerance should be controlled within ± 10 mm.

Are energy storage devices dangerous?

Energy storage devices can often supply significant short-circuit currents. Even at extra-low-voltage (ELV) this can present a serious risk of overheating and could lead to burns and/or fire. Means of protection against electric shock may be exacerbated when the installation is operating off grid.

What are electrical energy storage systems (EESS)?

Electrical energy storage systems (EESS) for electrical installations are becoming more prevalent. EESS provide storage of electrical energy so that it can be used later. The approach is not new: EESS in the form of battery-backed uninterruptible power supplies (UPS) have been used for many years. EESS are starting to be used for other purposes.

How to store the modules?

The modules shall be stored in a complete outer package. The storage area shall be protected pallets and boxes from damp, direct sunlight and waterproof (rain) measures; The modules should be placed neatly with a safe distance between the boxes. The spacing between boxes should be greater than 30cm (Figure 10);

How does Longi package a module?

LONGi packages each pallet as follows: Cardboard sleeve (remember that the glass side of the module is directly on the other side of the cardboard. Do not cut into the cardboard with a sharp object on the sides) Before you unpack your modules, check the shipping label to ensure you received the right modules.

Do you need a fuel oil forklift to unload a module?

If the modules are unloaded from long side forks, fuel oil forklifts are needed to unload. When someone is required to direct the hoisting box to fall during unloading, it shall be kept as flat as possible to avoid collision and throwing of the module box, and the ground shall be flat (Figure 8).
