How does a generator fuel system work?

The fuel system is designed to safely store fuel and transfer it to the generators when needed. The combustible nature of diesel fuel means that the bulk fuel storage is often separated from the generators and the buildings. However large generator sub-base tanks are sometimes used with packaged generator enclosures.

How do I design a fuel oil system for gensets?

Among the first steps of designing a fuel oil system for gensets is to establish runtime criteria in the event of a power outage (see "Runtime requirements").

How much fuel does a genset use?

Note that fuel consumption data for gensets at various loads is readily available from the manufacturers. For preliminary sizing of the fuel storage tanks, consider the following rule of thumb: 7 gal/hour of No. 2 fuel oil are needed per 100 kW of generator rating (see "Fuel oil design cheat sheet").

How does a diesel fuel system work?

Dual components such that one can be maintained while the other is active. The fuel system is designed to safely store fuel and transfer it to the generators when needed. The combustible nature of diesel fuel means that the bulk fuel storage is often separated from the generators and the buildings.

What are the standard fuel system elements?

Standard Fuel System Elements will include: Storage Tanks: To safely store fuel for required generator run time M200 Duplex Pumps: To move fuel from storage tanks to point of use M300 Filtration Unit: To filter dirt and water from fuel during long term storage. M400 Tank Fill Station: To receive fuel from delivery trucks and transfer to tanks.

How much fuel does a generator need?

For preliminary sizing of the fuel storage tanks, consider the following rule of thumb: 7 gal/hour of No. 2 fuel oil are needed per 100 kW of generator rating (see "Fuel oil design cheat sheet"). The fuel consumption rate (gph) multiplied by the desired runtime (hours) establishes the usable fuel requirement (gallons).
