

What is France's energy sector?

France's energy sector is dominated by fossil fuels and nuclear energy; the latter of which France is the most strenuous supporter and largest producer in Europe.

Can a smart grid improve French energy integration?

Despite the challenges, aggregating multiple decentralised sources, using so-called "smart grids" and goodwill could help with better integration. French electricity is currently mostly made up of nuclear energy, representing 69% of the mix.

Is French electricity a 'controllable' energy source?

French electricity is currently mostly made up of nuclear energy, representing 69% of the mix. However, what has been termed a "controllable" energy source should decrease in the coming years and replace solar and wind energy - both intermittent by nature.

Why is France set for record power exports in 2024?

France is set for record power exports in 2024 as local demand remains subdued and it keeps adding renewable capacity. Better generation from EDF's nuclear fleet is also helping keep a lid on wholesale prices, partly reversing bill increases caused by Europe's energy crisis.

How flexible is France's energy mix?

For France's energy mix, nuclear can also be flexible. "The share of nuclear power can go up or down; it is a flexible energy source, just like a gas or coal-fired power station," Barlier also said. "Today, we still rely heavily on the flexibilities provided by the existing energy mix, namely nuclear and hydro," said Calmels.
