

# How to eliminate the fault of power distribution energy storage cabinet

Can energy storage systems be configured during a fault period?

For energy storage configuration, some scholars analyzed the feasibility of an energy storage system configuration based on power constraints and the use of optimization algorithms, aiming at the power and capacity required to configure the energy storage system during the fault period [56,57].

What is the rational planning of energy storage system?

The rational planning of an energy storage system can realize full utilization of energy and reduce the reserve capacity of a distribution network, bringing the large-scale convergence effect of distributed energy storage and improving the power supply security and operation efficiency of a renewable energy power system [11,12,13].

Why should we review distributed energy storage configuration?

This review can provide a reference value for the state-of-the-art development and future research and innovation direction for energy storage configuration, expanding the application scenarios of distributed energy storage and optimizing the application effect of distributed energy storage in the power system.

What are the key issues in the optimal configuration of distributed energy storage?

The key issues in the optimal configuration of distributed energy storage are the selection of location, capacity allocation and operation strategy.

Why is distributed energy storage important?

Moreover, distributed energy storage is also a solution to the costly infrastructure construction of delayed power systems, and it plays a key role in improving energy efficiency and reducing carbon emissions, gradually becoming an important mainstay for the development of distributed generation, smart grid and microgrid [8,9,10].

How to cope with the future participation of energy storage systems?

In order to cope with the future participation of a large number of energy storage systems in the power market, the research should focus on the aggregated management of distributed energy storage, the way to participate in peak scheduling and the exploration of demand-side energy storage to participate in power grid operation. 3.
