

Material thickness requirements for energy storage containers

What factors limit the commercial deployment of thermal energy storage systems?

One of the key factors that currently limits the commercial deployment of thermal energy storage (TES) systems is their complex design procedure, especially in the case of latent heat TES systems. Design procedures should address both the specificities of the TES system under consideration and those of the application to be integrated within.

What are the chemical requirements for heat storage materials?

Chemical requirements are very similar for sensible and latent heat storage materials (Table 2). Candidate materials should have long-term chemical stability, no chemical decomposition, should be compatible with the container materials and the HTF, non-toxic and non-flammable, and they should present no phase segregation.

What is high temperature thermal energy storage?

High temperature thermal energy storage offers a huge energy saving potential in industrial applications such as solar energy, automotive, heating and cooling, and industrial waste heat recovery. However, certain requirements need to be faced in order to ensure an optimal performance, and to further achieve widespread deployment.

What are the different types of thermal energy storage containers?

Guo et al. [19] studied different types of containers, namely, shell-and-tube, encapsulated, direct contact and detachable and sorptive type, for mobile thermal energy storage applications. In shell-and-tube type container, heat transfer fluid passes through tube side, whereas shell side contains the PCM.

How can thermal energy storage materials be encapsulated?

The considered thermal energy storage materials were encapsulated in a cylindrical copper tube and was placed between the glass cover and absorber plate. The combination of paraffin wax and granular carbon powder was observed to attain a thermal efficiency of 78.31%.

How high should a stainless steel container be?

The stainless steel container of 2 mm thickness was tested for four different heights, namely, 12, 24, 36 and 48 cm. The length and width were fixed to 200 mm and 50 mm, respectively. The findings suggested to use lower container height.
