

What is Microgrid Certification Training?

Microgrid Certification Training is a 3-day course designed for all engineers who want to learn, design, or operate microgrids. It is also suitable for power traders to understand modern microgrid technologies and independent system operator personnel. The training covers understanding energy management systems (EMS) in microgrids, including centralized or decentralized microgrids.

What is Energy Management System (EMS) in a microgrid control strategy?

In a microgrid control strategy, an energy management system (EMS) is the key component to maintain the balance between energy resources (CG, DG, ESS, and EVs) and loads available while contributing the profit to utility. This article classifies the methodologies used for EMS based on the structure, control, and technique used.

What is EMS in a microgrid?

EMS in a microgrid relies on power system analysis to ensure efficient and reliable operation. The EMS uses this information to optimize the dispatch of distributed energy resources to meet demand while maintaining the stability of an MG under varying conditions.

What are the main topics of EMS in microgrids?

The audience will be introduced to the main topics of Energy Management Systems (EMS) in microgrids such as Data forecasting in microgrid EMS, DG scheduling, load dispatch, photovoltaic effect in EMS, effect of fuel cells in microgrid EMS, and optimization platform for microgrids.

What is a centralized microgrid EMS?

A centralized microgrid EMS requires a reliable, high-speed communication network between the central controller and local regulators. In addition, the current centralized control structure is not fully compatible with the plug-and-play functionality which is the key feature of microgrids.

What is the difference between Des and microgrid-level EMS?

The detailed operations on DES are performed by the embedded local regulators within DES while the microgrid-level EMS will control when to dispatch the stored energy and how much. The overall energy management objective for DES varies depending on the microgrid operational modes.
