

What is a solar inverter & how does it work?

This is a relatively low-cost addition to any solar PV system, yet within just a couple of seconds, it allows the inverter to automatically disconnect from the grid to your socket in the event of a power cut. This is useful for powering small loads, such as charging a mobile phone or a light source.

What size solar inverter do I Need?

You'll generally need an inverter that's 75% as big as your solar panel system's kilowatt-peak(kWp), which is how much solar energy it produces at standard test conditions. Every inverter has a startup voltage - that is, the amount of power needed for it to turn on and start converting DC electricity from your solar panels.

Do solar inverters need power?

Whilst all solar inverters need power to operate, it is possible to design a system in which the battery inverter provides power to the solar inverter so that even when there is no longer a grid connection, the entire house is isolated by the battery inverter.

What type of inverter do I need for a mains-connected PV system?

Inverters for mains-connected PV systems should be type approved to the Energy Networks Association's Engineering Recommendation G83/1 (for systems up to 16 A). NICEIC operates a Microgeneration Certification Scheme (MCS) which covers the design installation and testing of environmental technology installation work associated with dwellings.

How many string inverters can a solar system fit?

To get around this issue - or if you have more than 12 solar panels in your system - your installer can fit more than one string inverter. There is usually the maximum for residential properties, as this is typically enough for 36 panels.

Where should a solar inverter be installed?

Inverters are often fitted in lofts. This makes life easy for installers, but can dramatically affect system performance. At Naked Solar, we strongly recommend they are sited in a cooler place.
