

Photovoltaic inverter grid-connected to absorb reactive power

Can a grid-connected PV inverter control overvoltage and undervoltage?

Generally, a grid-connected PV inverter can be programmed to inject and absorb the reactive power. Hence, both the overvoltage and undervoltage conditions can be regulated using the reactive power control ability. The dq components theory, which will be described in Section 2, can be used to perform the controlling mechanism efficiently.

How does a grid inverter work?

The inverter injects active power into the grid during normal conditions. It also supports the grid-network with reactive power during low voltage faults, complying with the grid code. The DC-link and the output current remains within the nominal values for 50% sag and short-circuits fault, while the inverter remains connected to the grid.

How does an inverter regulate voltage levels in a utility grid?

The proposed novel method enables an inverter to inject the required level of reactive power to regulate the voltage levels of the utility grid within specified limits. In the process, the inverter does not absorb active power from the grid for its internal operation.

How does a photovoltaic power plant control grid voltage?

Under this control strategy, the photovoltaic power plant can regulate the grid voltage more effectively, and the active and reactive power losses of the grid are minimized on the premise that the grid voltage is maintained within the required range.

What is the active and reactive power of the inverter?

The active and reactive power of the load is set to 10 kW and 1000 VAR, respectively. The inverter maintains its active power as zero to feed pure reactive power to the grid efficiently. Output waveforms of the active and reactive powers of the system are shown in Fig. 6. The (a) reactive and (b) active powers at the PCC--Case 1.

Can a PV inverter be used as a reactive power generator?

Using the inverter as a reactive power generator by operating it as a volt-ampere reactive (VAR) compensator is a potential way of solving the above issue of voltage sag. The rapid increase in using PV inverters can be used to regulate the grid voltage and it will reduce the extra cost of installing capacitor banks.
