

Photovoltaic panels function throughout the house

How do solar photovoltaic panels work?

Solar photovoltaic panels transform free energy from the sun into electricity. This is then converted from a DC current to an AC current via an inverter, to make it suitable for household use. The panels capture energy from the sun and convert it into DC electricity via groups of photovoltaic (PV) cells.

Can solar panels power your home?

Solar power has many applications, from powering calculators to cars to entire communities. It even powers space stations like the Webb Space Telescope. But most people are concerned about how solar panels can power their house and reduce their electricity bill. How Do Solar Panels Work? Here's a step-by-step overview of how home solar power works:

How does home solar power work?

Here's a step-by-step overview of how home solar power works: Excess solar energy is stored in batteries or pushed onto the grid to power local systems (like your neighbor's house!) Now that we've covered the basics, let's break down how solar panels work in more detail. How does solar power work? The photovoltaic effect explained

How does a solar panel generate electricity?

At the heart of a solar panel's ability to generate electricity is the photovoltaic (PV) effect. Discovered in 1839 by French physicist Edmond Becquerel, the PV effect is the process by which solar cells within the panel convert sunlight into electricity.

What are solar panel cells?

Solar panel cells are referred to as photovoltaic cells. "Photovoltaic" simply means that they convert sunlight into electricity. Many of these small cells link together to form a solar panel. These tiny cells are the key to how solar energy works.

How does the photovoltaic effect occur?

The photovoltaic effect occurs when photons from the sun's rays hit the semiconductive material (typically silicon) in the cell of the solar module. The photons activate electrons, causing them to free themselves from the semiconductive material. Photons hit the solar panel causing electrons to be freed during the photovoltaic effect.
