How does the Portuguese national transmission grid work?

The Portuguese National Transmission Grid connects the major energy producers to the consumption centres, through delivery points, which supply the major industrial consumers and ensure the connections to the distribution network, from which the majority of the final consumers are supplied.

How much wind power does Portugal produce?

The pumped-storage hydroelectricity plant at Frades works as 880 MW for generation and 780 MW for pumping. Portugal produced 20% of electricity with wind power in 2017 and had the average year capacity of 14% of wind power in the end 2010. Wind power capacity was 3,357 MW in end 2009 and 3,702 MW in end 2010.
