

# The energy storage cabinet is placed in water

Why do energy storage units need a cabinet structure?

Modules within the energy storage unit can easily be mounted after the cabinet structure is in place to avoid heavy lifting of the sections, and also to avoid damage during a ship's construction period. The cabinet structure protects against solid foreign objects and ingress of water.

What is energy storage unit?

Energy Storage Unit has a modular design to enable highly cost efficient, standardised and scalable solutions. The sealed cabinet has a liquid thermal management system which ensures that the battery cells are safely and efficiently cooled to deliver the calculated life-time of the application.

How does a mechanical storage system work?

Mechanical storage systems work on the basis of storing available and off-peak excessive electricity in the form of mechanical energy. Once the demand for electricity power overcomes the available energy supply, the stored energy would be released to meet with the energy demand.

How is thermal energy added to a storage tank/store buried underground?

Thermal energy is added to or removed from the insulated tank/store buried underground by pumping water into or out of the storage unit. Excess heat is used to heat up the water inside the storage tank during the charging cycle. Hot water is taken from the top of the insulated tank/store and used for heating purposes during the discharging cycle.

How does an energy storage unit work?

The energy storage unit is pre-assembled and transported in sections for simple installation. Modules within the energy storage unit can easily be mounted after the cabinet structure is in place to avoid heavy lifting of the sections, and also to avoid damage during a ship's construction period.

Which energy storage system should I choose?

Specific storage solutions might be chosen based on the application's performance needs. For large-scale energy storage applications, pumped-hydro and thermal energy storage systems are ideal, whereas battery energy storage systems are highly recommended for high power and energy requirements.

The water is stored in a reservoir and, in periods of high demand, released through turbines to create electricity. Hydropower - including pumped storage - is expected to ...
