How does a photovoltaic cell work?

The working principle of a photovoltaic (PV) cell involves the conversion of sunlight into electricity through the photovoltaic effect. Here's how it works: **Absorption of Sunlight:** When sunlight (which consists of photons) strikes the surface of the PV cell, it penetrates into the semiconductor material (usually silicon) of the cell.

What is the working principle of a photovoltaic cell?

Working principle of Photovoltaic Cell is similar to that of a diode. In PV cell, when light whose energy ($h\nu$) is greater than the band gap of the semiconductor used, the light get trapped and used to produce current.

What is photovoltaic effect based on?

This conversion is based on the principle of photovoltaic effect in which DC voltage is generated due to flow of electric current between two layers of semiconducting materials (having opposite conductivities) upon exposure to the sunlight. A solar cell is a type of photoelectric cell which consists of a p-n junction diode.

What is a solar cell & a photovoltaic cell?

Solar Cell Definition: A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect.

What is a silicon photovoltaic cell?

Silicon photovoltaic cell, also referred to as a solar cell, is a device that transforms sunlight into electrical energy. It is made of semiconductor materials, mostly silicon, which in turn releases electrons to create an electric current when photons from sunshine are absorbed. **Monocrystalline Silicon Solar Cells**

What are the different types of photovoltaic cells?

The different types of Photovoltaic cells are: Monocrystalline Silicon Cells, Polycrystalline Silicon Cells, Thin-Film Solar Cells, Multi-junction (Tandem) Solar Cells, Organic Photovoltaic Cells (OPV) and Perovskite Solar Cells **What is the Efficiency of Photovoltaic Cells?**
