

# Uganda most efficient way to store electricity

Does Uganda have a strong energy sector?

Like many countries in Sub-Saharan Africa, Uganda has focused its energy sector investments largely on increasing energy access by increasing energy supply.

Why should Uganda diversify its electricity sector?

Diversifying Uganda's electricity sector is absolutely essential. An energy mix plays a central role in improving energy security and ensuring a reliable supply of electricity. An overdependence leaves a nation vulnerable to supply disruptions, price volatility, and geopolitical instability.

Do Ugandans have access to electricity & cooking solutions?

This is typical of Uganda where the majority of the populace fall under tier 1-4 in terms of access to electricity and cooking solution indicators and world considered them to have no access at all (Bhatia and Angelou, 2015).

What percentage of Ugandans have access to electricity?

Both grid and off-grid connections account for 42% of access to electricity in Uganda. The term grid connection refers to access to power through the national electricity grid. The Uganda National Household Survey 2019/2020 states that the Ugandan electricity grid reaches 18.9% of Ugandans, mainly in urban areas.

How much electricity does Uganda use per capita?

As described in a prior blog article, the per capita electricity consumption in Uganda was only 75 kWh/a in 2019, while in Germany it is 6787 kWh/a. Notably, Uganda's power sector is primarily driven by renewable energy sources, accounting for an impressive 98% of electricity generation.

Does Uganda have an electricity grid?

The Uganda National Household Survey 2019/2020 states that the Ugandan electricity grid reaches 18.9% of Ugandans, mainly in urban areas. Off-grid access describes alternatives to the national grid, such as Solar Home Systems, Mini grid systems, or smaller power-generating devices.

## Uganda most efficient way to store electricity

The power industry even has a way to compare the cost of fuel-based and fuel-free electricity on an apples-to-apples basis - it's called the Levelized Cost of Electricity (LCOE). This approach divides the lifetime costs to build, operate, and fuel a power plant by the total amount of electricity generated over that time.
