Can magnetic wedges be used in a wind power generation system?

Furthermore, magnetic wedges can be included in stator constructions for all above-mentioned electric machines with open slots, where magnetic wedges in open slot can reduce core losses and improve power factor, . One of the key challenges in wind power generation systems is various electric machine and drive failures.

What is a wind energy conversion system?

A wind energy conversion system (WECS), converts the kinetic energy of the wind into mechanical power. In the next step, mechanical power is used to rotate generators in order to produce electrical energy. Wind turbines, electric generators, control systems, and power electronic interface devices are the four main components of the WECS.

Are electric machines and drives suitable for wind power generation?

This paper has presented a comprehensive review of electric machines and drives for wind power generation in terms of challenges and opportunities. Compared to conventional electric machines for wind power generation, including SCIMs, WRIMs, DFIMs, and EESMs, PMSMs are regarded as the most promising candidate.

Why are power electronics used in wind energy systems?

Power electronics are used in the WECSs to decrease mechanical stress and boost reliability, energy output, and performance. It makes it possible for the wind energy system as a whole to function like a controllable generation unit, which is appropriate for greater wind power grid integration.

Are superconducting electric machines suitable for wind power generation?

In , Snitchler et al. presented a 10-MW superconducting electric machines for wind power generation. It was shown that superconducting technology enables a significant reduction in weight and size as compared to conventional copper and PM-based machines. Superconducting machines. (a) Superconducting electrically excited machine .

Why do we need induction machines for wind power generation?

Advanced manufacturing and assembly techniques are imperative in order to achieve the optimal performance of electric machine-drive systems for energy conversion, as well as avoid any potential failures. Development of induction machines for wind power generation naturally results in larger machine ratings and size.
